

Kelley Beekeeping

SERVING THE BEEKEEPER SINCE 1924

Pollen Cleaner

Pollen should be frozen after collection, and then dried in a table top food drier and cleaned. The cleaner takes out about all of the fine dust and foreign materials and leaves for a nice looking product. It will clean approximately 10 gallons per hour if you were set up to run that much through. The small electric fan blows across the pollen as it is fed through the tunnel, allowing chaff and debris to be removed just before the pollen falls into the collection box. While it does not always get it totally "health food store" clean in one run, second runs are no problem.
